Tick Control Program

Red Carpet Landscaping has an exclusive division with dedicated trucks to provide your family with the safest most effective 100% organic product to safeguard your outdoor activities. We recommend 5 applications for most properties. Red Carpet Landscaping's Tick Control Program uses cedar oil. Cedar Oil dissolves the insect egg and larvae eliminating the next generation of arthropod while the cedar aroma creates a barrier of entry making the treated area off limits to flying or crawling pests. Cedar oil is a natural essential oil that provides a pheromone interruption agent that impairs the insects mental capacity. When combined with ethyl lactate, a raspberry bio-solvent it becomes instrumental in triggering instant erosion and dehydration of the insects exo-skeleton and subsequently, the egg and larvae. For every insect that you see, there are 99 more in egg and larvae stage. Exposure to a water solution with cedar oil and ethyl lactate will destroy the egg and larvae stage, breaking the egg layer cycle and eliminating the next generation of insects. This process is the safest most effective program in the industry.

Powerseeding

Restore your lawn to its beautiful, healthy state. Red Carpet landscaping's over seeding is the best way to increase turf density and improve the overall health and appearance of your yard. Red Carpet landscaping over seeder plants the right amount of seed at the right soil depth to create a beautiful lawn.

Aeration

As lawns age or sustain heavy use from play, sports activities, pets, vehicle traffic and parking, soil compaction can result. Compaction greatly reduces the pore space within the soil that would normally hold air. Roots require oxygen to grow and absorb nutrients and water. Compaction reduces total pore space and the amount of air within the soil. It has a negative impact on nutrient uptake and water infiltration, in addition to being a physical barrier to root growth. This results in poor top growth and lawn deterioration.

Core aeration can benefit your lawn by:

- Increasing the activity of soil microorganisms that decompose thatch.
- Increasing water, nutrient and oxygen movement into the soil.
- Improving rooting.
- Enhancing infiltration of rainfall or irrigation.
- Helping prevent fertilizer and pesticide run-off from overly compacted areas.

Grubs

Eggs that hatch into white grubs worms and begin feasting on the roots of your grass, potentially destroy part or even all of your grass. Red Carpet Landscaping's preventative grub control is applied before the treat of grub damage can occur, stopping grubs before they attack your lawn.

Soil enrichment

Here are some important facts:

- It brings the ph (acidity) level in balance.
- It will slow thatch build up, which can choke growth and reduce turf density.
- It will increase the effectiveness of fertilizer by making it more readily available to the grass plant.
- It will also reduce the possibility of lawn fungus problems.
- It's 100% natural!

Tree and Shrub Program

Red Carpet Landscaping has an exclusive Tree and Shrub Division that will provide your landscape with five treatments spaced throughout the year. These treatments will target insects, their eggs, diseases, and enhances plant growth. Not included in the basic program we also offer deep root fertilization, anti desiccant spray to protect your plants from harsh winters, and deer replants.

If you are interested in any of there services please call our office at (203) 212-2498 or send us an email to sales@RedCarepetLandscaping.com and we will give you a complete estimate. If you are already signed up for service these programs are available to you.
